Infrastructure Interdependencies: Transport sector economic dependency with other critical infrastructure sectors in the UK

Nikos Kalyviotis, Chris Rogers & Miles Tight

**Department of Civil Engineering
Edgbaston Birmingham B15 2TT
United Kingdom**

Introduction

There is an ongoing debate on infrastructure investment priorities related to: Energy, Water, Transport, Waste, Communication

(Hall et al., 2016; iBUILD, 2015; Liveable Cities, 2015; National Infrastructure Plan, 2013)

In 2008 their contribution to GVA in the UK economy was 9.2%

(Hall et al., 2016) ...

... with Transport having the largest contribution

Aims and Objectives (aligning with iBUILD & Liveable Cities projects)

- *Understand the Value Interdependencies of Transport Infrastructure (this presentation)*
- *Devise a new Transport Business Model that takes account on these interdependencies (future research)*

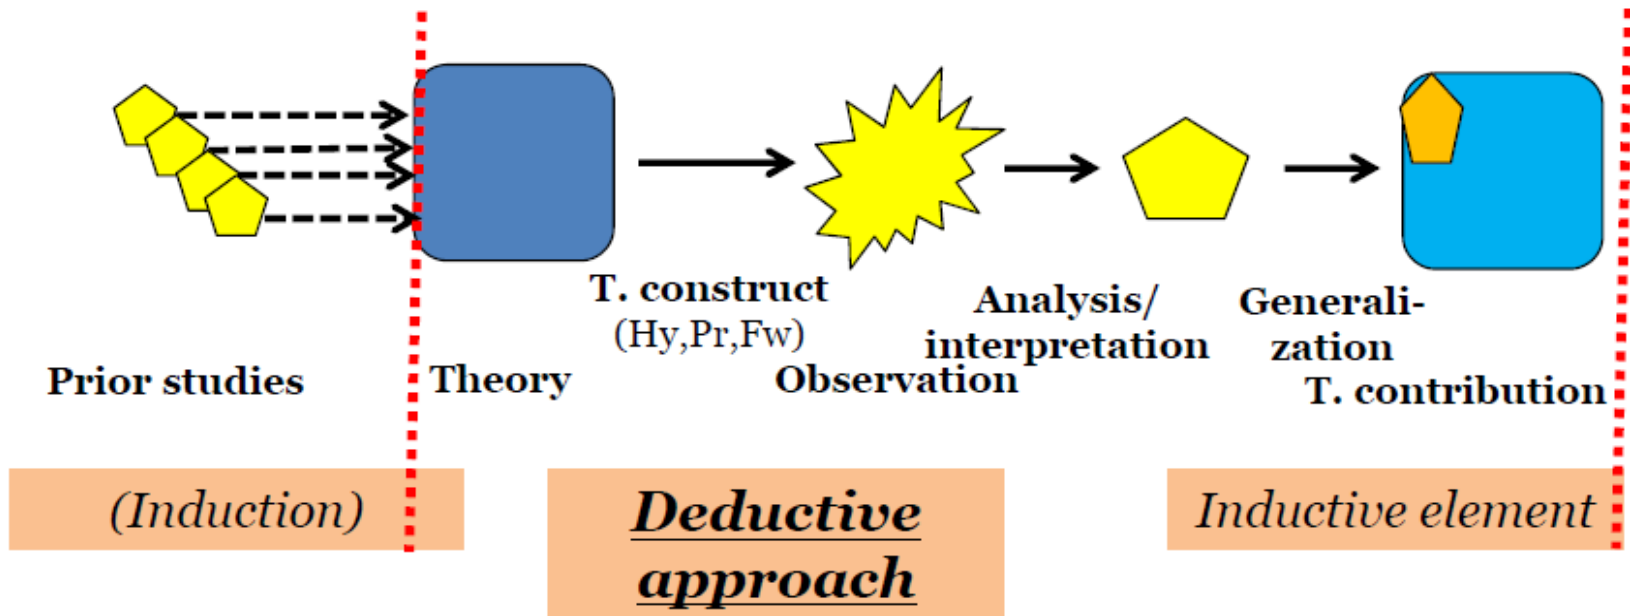

Theoretical Methodology

Scientific ideal: Positivism (*Wainwright & Forbes, 2000*)

- Hypothetico-deductive model
- Quantitative methods

Deductive approach (*May, 2011*)

Theoretical Frame of Reference

Starting point:

- Business models focus on value creation and how value is captured (*Magretta, 2002; Casadesus-Masanell & Ricart, 2010*)
- Infrastructures are related to
 - “synergies” by economists (*Steinmueller, 1996*)
 - “interconnections” by engineers (*Hall et al., 2016*)
 - “interdependencies” in this study

Research propositions (deduction):

- From theory: e.g. infrastructure interdependencies

Research Gap of this Study:

- The dominant business model focuses on the economic value of each infrastructure **without** considering the **infrastructure interdependencies** (between different infrastructures)

Theoretical Frame of Reference

Research proposition: Economic Infrastructure Interdependencies

- *Tran et al.* (2016, p. 227-240) conclude that: **Energy and Transport** infrastructure are **complementary** as any change in the Energy-Transport relationship will require at least new fuelling infrastructures and *“even aggressive energy demand reduction”* applied to the energy part of the balance *“means that the requirement for electricity infrastructure will be at least as high as present”* (*Tran et al., 2016, p. 230*).
- Waste and Transport interdependencies are studied in terms of economic value (considering wastewater and solid waste, but not air pollution; e.g. carbon dioxide emissions). The sewerage system is *“consisting of a piped system collecting and transporting wastewater to treatment plants”* (*Wong, 2006, p.213*). The wastewater infrastructure requires high capital investment for transport through pipelines (*Tjandraatmadja et al., 2005, p. 146*), while solid waste is transported via trucks. So it is safe to conclude that **Waste and Transport complement each other.**

Theoretical Frame of Reference

Research proposition: Economic Infrastructure Interdependencies

- *Selvanathan & Selvanathan (1994)* discussed Transport and Communications economic dependences, having studied them in the UK and Australia. They compared (public and private) **Transport and Communications** and found that they **are substitutes** in both countries (*Selvanathan & Selvanathan, 1994, p.5*).
- The **Water Supply** infrastructure system **and Transport are always complementary**. Whether in the UK, EU and similar situations, where traditional water supply regimes exist, or in extreme socio-economic and/or climate scenarios, large-scale water transfer infrastructure will be required "*to alleviate the disparity between regions with water scarcity and those with water abundance*" (*Hall et al., 2016, p.130-131*).

So it is expected that value added in **Energy, Waste and Water infrastructures** will **add and/or create value to Transport**, whereas value added or created in **Communications infrastructures** will **reduce value to Transport**.

Practical Methodology

- Economic Value

- Mathematical modelling with secondary data

$$Y_c = b_0 + b_1 \cdot X_1 + b_2 \cdot X_2 + \dots + b_v \cdot X_v \text{ (Giannopoulos, 2002), where}$$

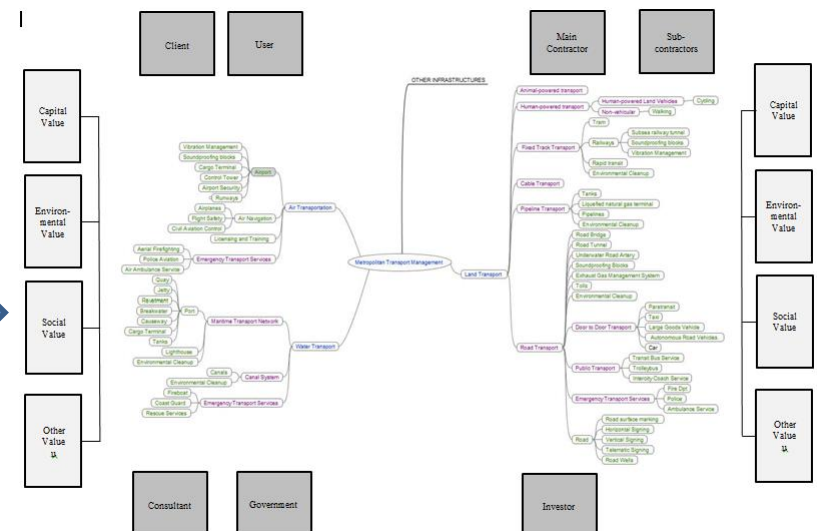

Y_c : dependent variable, and X_1, X_2, \dots, X_v : independent variables and $b_0, b_1, b_2, \dots, b_v$: are partial regression coefficients.

- Social Value (See Parallel Session III, **TOMORROW 11:00-12:00**)

- Sigmoid functions:

$$f(x) = \tanh(x) \text{ and/or } f(x) = \operatorname{erf}\left(\frac{\sqrt{\pi}}{2} x\right)$$

- Business Model

Practical Methodology

There are three major **economic factors** that are used to measure the national income and output:

- [1] **Gross Domestic Product (GDP)**
- [2] **Gross National Product (GNP)**
- [3] **Net National Income (NNI)**

Of interest for this study is the grand total of all revenues (capital value), which include incomes into other sectors and create dependences. This, by definition, is the **Gross Value Added (GVA)** and it relates with **GDP**:

$$GVA = GDP + \text{subsidies on products} - \text{taxes on products}$$

Following the **three-step process analysis** “networks and cohorts” (Hill, 1993)

STEP 1: The symmetric (product by product) Input-Output tables includes product input-output groups (IOGs; see ONS, 2015):

2010 version: 114 IOGs

1990 version*: 123 IOGs

2005 version: 123 IOGs

1984 version*: 102 IOGs

1995 version: 138 IOGs

*the industry of Waste was not considered as a separate product/service which adds value to the economy

Empirical Findings and Analysis

Step 3: Five linear equations for five unknown variables can be solved with Cramer's rule:

Value added

$$\begin{bmatrix} -1,610 & 838 & -333 & -24 & 1 \\ -1,397 & 148 & -875 & -33 & 1 \\ -845 & 107 & -507 & -25 & 1 \\ -678 & 0 & -270 & -22 & 1 \\ -248 & 0 & -259 & -54 & 1 \end{bmatrix} \cdot \begin{bmatrix} b_1 \\ b_2 \\ b_3 \\ b_4 \\ b_5 \end{bmatrix} = \begin{bmatrix} 74,447 \\ 124,245 \\ 92,785 \\ 65,992 \\ 16,805 \end{bmatrix}$$

$$b_i = \frac{Det(b_i)}{Det}, \quad i = 1, \dots, 5$$

Empirical Findings and Analysis

$$Y_a = 9.80 \cdot X_1 + 14.8 \cdot X_2 - 133.81 \cdot X_3 + 1,62275 \cdot X_4 + 72,205.63$$

- X_1 : value added from Energy
- X_2 : value added from Waste
- X_3 : value added from Communication
- X_4 : value created from Water

This equation shows the economic interdependences (added value) between the different sections, but not the actual value creation.

This happens because we calculate the **VALUE ADDED** by each sector to Transport **without considering how much value was added to each sector by Transport**. The value created is the difference between the value added and the value produced.

Empirical Findings and Analysis

The actual value creation may be calculated with the input (consumption) and output model (production) and “be transformed into a simple, operational model of interdependence by imparting a regularity relationship between inputs and outputs” (Rose, 2005, p.4) by aligning with the methodology described by Rose and “by assuming a fixed relationship between inputs and outputs” (Rose, 2005, p.4).

Value created

$$\begin{bmatrix} 1,662 & 192 & 514 & 43 & 1 \\ 1,765 & 380 & 1,628 & 82 & 1 \\ 1,009 & 214 & 1,016 & 54 & 1 \\ 753 & 0 & 571 & 43 & 1 \\ 606 & 0 & 411 & 65 & 1 \end{bmatrix} \cdot \begin{bmatrix} b_1 \\ b_2 \\ b_3 \\ b_4 \\ b_5 \end{bmatrix} = \begin{bmatrix} 1,282 \\ 1,698 \\ 1,023 \\ 397 \\ 521 \end{bmatrix}$$

$$b_i = \frac{Det(b_i)}{Det}, \quad i = 1, \dots, 5$$

Empirical Findings and Analysis

$$Y_{cr} = 0.32 \cdot X_{cr1} + 2.99 \cdot X_{cr2} - 0.35 \cdot X_{cr3} + 5.27 \cdot X_{cr4} + 125.74$$

- X_{cr1} : value created from Energy
- X_{cr2} : value created from Waste
- X_{cr3} : value created from Communication
- X_{cr4} : value created from Water

To calculate the **actual value** creation we would need the data from at least two more years, as two more variables should be considered: **value from Transport to Transport** and value from **Other Goods and Services to Transport**. Based on the given data, it may be assumed that the difference of the total value produced with the two extra variables is the output of the value production of the four previous sections, which is **a strong assumption!**

Conclusions and Recommendations

- The hypothesis of **Economic Value Interdependencies of Transport Infrastructure** was verified with some deviations.
 - Energy, Waste and Water growth adds value to Transport (propositions were verified)
 - Communication growth deducts value to Transport (proposition was verified)
- Transport infrastructure dependencies ranking :
 - 1) Water
 - 2) Waste
 - 3) Energy
 - 4) Communication

Conclusions and Recommendations
